Markov Decision Processes Motivation

Markov Decision Processes(MDP)

Definition

An MDP is a tuple (S, A, T, γ, R)

- *S* is a finite set of states
- A is a finite set of actions
- $\mathcal{T}: S imes A imes S
 ightarrow [0,1]$ is the transition probability function
- $\gamma \in [0,1)$ is the discount factor
- $R:S
 ightarrow\mathbb{R}$ is the reward function

• • = • • =

Markov Decision Processes Motivation

Bellman Equations

Definition

```
A policy is a map \pi: S \to A
```

Definition

The value of a policy π under a reward function R $V^{\pi}(s) = R(s) + \gamma \sum_{s'} T(s, \pi(s), s') V^{\pi}(s')$

Definition

The **Q**-function of a policy π under a reward function R $Q^{\pi}(s, a) = R(s) + \gamma \sum_{s'} T(s, a, s') V^{\pi}(s')$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Markov Decision Processes Motivation

Motivation

Problem

Learn the reward function of an underlying Markov Decision Process given

- O behaviour of an expert
- Q dynamics of the system

▲ □ ▶ ▲ □ ▶ ▲ □ ▶

Markov Decision Processes Motivation

Tasks

Reward Learning

Estimate the reward function as accurately as possible

- Implementation of the second secon
- 2 preference elicitation

Apprenticeship Learning

Use observations of expert behaviour to decide own behaviour

- olicy learning
- ② better generalization of tasks

lnference Algorithm

Bayesian Inference

- evidence is used to infer the probability that a hypothesis may be true
- given a hypothesis H and evidence E, we define:

Definition

Prior probability P(H)

Definition

Posterior probability
$$P(H|E) = \frac{P(E|H)P(H)}{P(H)}$$

(日) (同) (三) (三)

Inference Algorithm

Main Idea

- the hypothesis: is the reward function that explains the agent's behaviour
- the evidence: observations about expert behaviour
- the evidence is used to infer the probability that a hypothesis may be true(i.e. the posterior distribution of the rewards, from a prior distribution)
- important how to choose the prior:
 - uniform distribution, if there is no information given
 - Laplacian or Gaussian, if most states have negligible rewards
 - Beta, if the MDP is a planning-type problem (most states have low rewards, but a few, goal states have high rewards)

イロト イポト イヨト イヨト

Inference Algorithm

Reward Learning

learn a reward function

Definition

Error loss function $:L(R,\overline{R}) = \parallel R - \overline{R} \parallel^2$, where:

- R is the actual reward
- \overline{R} is the estimated reward
- if R is drawn from the posterior distribution, then $L(R, \overline{R})$ is minimized by setting \overline{R} to the mean of the posterior
- use a maxiumum a posteriori estimator (MAP) as the estimator

・ロト ・ 同ト ・ ヨト ・ ヨト

Inference Algorithm

Apprenticeship Learning

• want to learn a policy (i.e. how to act), given expert behaviour

Definition

Class of policy loss functions $:L(R,\pi) = || V^*(R) - V^{\pi}(R) ||^p$, where:

- V^* is the vector of optimal values for each state, under the optimal policy π for R
- \bullet want to find a π that minimizes the policy loss over the posterior distribution for ${\it R}$
- \bullet direct minimization is hard; instead, find optimal policy π for the mean reward function

イロト イポト イヨト イヨト

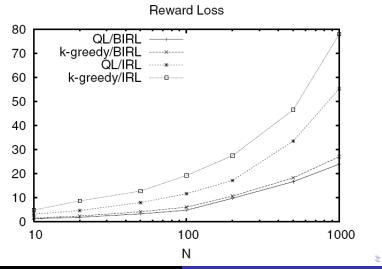

Inference Algorithm

PolicyWalk Sampling Algorithm

 $\begin{aligned} & \text{Algorithm PolicyWalk}(\text{Distribution } P, \text{MDP } M, \text{Step Size } \delta) \\ & 1. \text{ Pick a random reward vector } \boldsymbol{R} \in \mathbb{R}^{|S|}/\delta. \\ & 2. \ \pi := \text{PolicyIteration}(M, \boldsymbol{R}) \\ & 3. \ \text{Repeat} \\ & (a) \ \text{Pick a reward vector } \tilde{\boldsymbol{R}} \text{ uniformly at random from the} \\ & \text{neighbours of } \boldsymbol{R} \text{ in } \mathbb{R}^{|S|}/\delta. \\ & (b) \ \text{Compute } Q^{\pi}(s, a, \hat{\boldsymbol{R}}) \text{ for all } (s, a) \in S, A. \\ & (c) \ \text{If } \exists (s, a) \in (S, A), Q^{\pi}(s, \pi(s), \tilde{\boldsymbol{R}}) < Q^{\pi}(s, a, \tilde{\boldsymbol{R}}) \\ & \text{i. } \ \tilde{\pi} := \text{PolicyIteration}(M, \tilde{\boldsymbol{R}}, \pi) \\ & \text{i. } \ \tilde{\pi} := \text{PolicyIteration}(M, \tilde{\boldsymbol{R}}, \pi) \\ & \text{ii. Set } \boldsymbol{R} := \ \tilde{\boldsymbol{R}} \ \text{and } \ \pi := \ \tilde{\pi} \ \text{with probability} \\ & \min\{1, \frac{P(\tilde{\boldsymbol{R}}, \pi)}{P(\boldsymbol{R}, \pi)}\} \\ & \text{Else} \\ & \text{i. Set } \boldsymbol{R} := \ \tilde{\boldsymbol{R}} \ \text{with probability } \min\{1, \frac{P(\tilde{\boldsymbol{R}}, \pi)}{P(\boldsymbol{R}, \pi)}\} \\ & \text{4. Return } \boldsymbol{R} \end{aligned}$

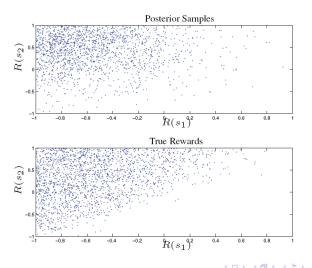

- generate samples from the prior distribution (of rewards)
- the sample mean is the estimate of the true mean of the distribution

Reward Loss

Monica Dinculescu Bayesian Inverse Reinforcement Learning

Posterior Distributions

э

Conclusions

- reward function can be learned by posing the problem as a Bayesian larning task
- algorithm yields a probability distribution over reward functions that is close to the true one
- policy learning is possible
