

IFT 6802  
Introduction to Prolog

Par Jean Vaucher  
(& Laurent Magnin)

Université  de Montréal

Prolog

**A programming language based on the formalism and the concepts of formal logic.**

- ◆ PROgrammation LOGique
- ◆ Robinson (resolution)
- ◆ Kowalski (Logic Programming)
- ◆ Colmerauer & Roussel ( PROLOG )
- ◆ Warren DEC-10 (Quintus)
- ◆ I.C.O.T. PSI Engine
- ◆ 5th Generation

Université  de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 2

Declarative programming

- Concise Notation
- Programming by specification
- Constraints
- DB Programming Facts and Rules

Université  de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 3

LOGIC PROGRAMMING BASICS

- Terms
  - ◆ relationship between objects
    - ◆ loves (peter,jane)
- Variables & functional expressions
  - ◆ loves (X, mother(jane))

Université  de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 4

LOGIC PROGRAMMING BASICS (suite)

- ◆ <head> :- <body> .
- RULES
  - ◆ bird(B) :- flies(B), lays\_eggs(B).
- FACTS (no body)
  - ◆ flies (sparrow).
- QUERY (no head)
  - ◆ :- loves(X,peter) , girl(X).
    - ◆ 1) Prove that there is someone who loves Peter and is a girl
    - ◆ 2) Find values of X so that the terms in the query match facts in the database

Université  de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 5

Facts

- ◆ parent (john, robert) .
- relationship (predicate) : parent
- objects: **John, Robert**
  - ◆ John is a parent of Robert
- Interpretation
  - ◆ A parent of John is Robert. ???
- Arity
  - ◆ 2 / parent (john, robert) .
  - ◆ 1 / man ( john ) .
  - ◆ 0 / hot .

Université  de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 6

### Program

- Set of Facts
  - likes ( fred , susan ) .
  - likes ( mary , fred ) .
- Database
  - likes ( fred , beer ) .
  - likes ( susan , fred ) .
  - likes ( jack , mary ) .
  
  - man ( jack ) .
  - man ( fred ) .
  
  - woman ( susan ) .
  - woman ( mary ) .
  
  - drink ( beer ) .

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 7

### Queries

- Is fred a man ?
  - ◆ :- man ( fred ) .
  - ◆ => ok
- Is **man(fred)** TRUE ?
- Is the *fact* **man(fred)** in the database ?
  
- Goal to be proved

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 8

### Complex Queries

- Does Fred like Mary ?
  - ◆ :- likes ( fred , mary ) .
  - ◆ => **no**
- Conjunction of goals
  - ◆ :- likes ( fred , beer ) , man ( fred ) .
  - ◆ => **ok**

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 9

### Variables

- **An unspecified individual**
- **Denoted by initial Capital letter**
  - ◆ Who likes Mary ?
  - ◆ Is there an X such likes(X ,mary) can be found in the DB ?
    - ◆ :- likes ( X , mary ) .
    - ◆ => X = jack

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 10

### Variables

- **Multiple answers**
  - ◆ What does Fred like ?
    - ◆ :- likes ( fred , T ) .
    - ◆ => T = susan ;
    - ◆ T = beer
  - ◆ What girls does Fred like ?
    - ◆ :- likes ( fred , G ) , woman ( G ) .
    - ◆ => G = susan

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 11

### PERT Example

- **Prolog description**
  - ◆ **arc ( Id, start-node, end-node, duration, resource)**
    - arc (1,n1,n2,1,r1).
    - arc (2,n1,n3,4,r2).
    - arc (3,n2,n3,2,r3).
    - arc (4,n2,n4,3,r1).
    - arc (5,n2,n5,1,r2).
    - arc (6,n3,n6,4,r3).
    - arc (7,n5,n4,2,r1).
    - arc (8,n4,n7,3,r2).
    - arc (9,n5,n6,1,r3).
    - arc (10,n6,n7,4,r1).

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 12

## DATABASE PROGRAMMING

- Does arc4 link nodes 2 and 4 ?
  - ◆ `:- arc(4,n2,n4,_,_).`
  - ◆ => OK
- What is the duration of activity 6 and what resource does it use ?
  - ◆ `:- arc(6,_,_,D,R).`
  - ◆ => D=4, R=r3

## DATABASE PROGRAMMING

- Does activity 7 follows directly activity 5.
  - ◆ `:- arc(5,_,_,_), arc(7,N,_,_).`
  - ◆ => N=5 % Yes, they meet at node 5
- What activities start at node 5 ?
  - ◆ `:- arc(A,n5,_,_).`
  - ◆ => A=7
  - ◆ A=9

## PROLOG's Algorithm

- `:- term1, term2, . . . , termn .`
  - ◆ **equivalent to**
- for\_all DB matches for term1 do
  - for\_all DB matches for term2 do
    - for\_all DB matches for termn do
      - PRINT VALUES OF VARIABLES ( and optionally stop );
- **BACKTRACKING**
  - ◆ **When a term fails, Prolog uses another match for the previous term and tries again.**

## Example

```
likes ( mary , fred ) .
likes ( fred , susan ) .
likes ( fred , beer ) .
likes ( susan , fred ) .
likes ( jack , mary ) .

woman ( susan ) .
woman ( mary ) .

:- likes( fred,G), woman(G).
likes ( mary , fred )
likes ( fred , susan )
=> woman(susan)
woman (susan)
=>> G=susan
woman ( mary ) .
likes ( fred , beer )
=> woman(beer)
woman ( susan ) .
woman ( mary ) .
likes ( susan , fred ) .
likes ( jack , mary ) .
```

## Rules

- `<head> :- <tail>`
  - ◆ Head is true IF tail is true
  - ◆ To prove Head , try to prove tail
- **Examples:**
  - ◆ friends (A,B) :- likes (A,B) , likes (B,A).
  - ◆ person (P) :- woman (P) .
  - ◆ person (P) :- man (P) .
  - ◆ likes (M, mary) :- man (M) .

## Examples

```
likes ( mary , fred ) .
likes ( fred , susan ) .
likes ( fred , beer ) .
likes ( susan , fred ) .
likes ( jack , mary ) .

woman ( susan ) .
woman ( mary ) .

man ( fred ) .
man ( jack ) .

:- friends( susan , F ) .
=> F = fred

:- likes ( F , mary ) .
=> F = jack ;
F = fred ;
F = jack

:- person ( X ) .
=> X = susan ;
X = mary ;
X = jack ;
X = fred
```

### Operators

- **Infix Notation**
  - ◆  $1 + 2$
  - ◆  $'+(1,2)$
- **Unary & Binary operators**
  - ◆  $op(500, yfx, +)$ .
- **Useful Operators**
  - ◆ arithmetic:
    - $+ - * /$
    - $is :=$  evaluable predicates
  - ◆ comparison:
    - $> < =:=$

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 19

### Use of Arithmetic Operators

```

:- X is 4 + 5, Y is (X - 1) * 2, 2 is 3-1.
X = 9
Y = 16
Yes

```

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 20

### Unification

- **Unification is a symmetric operation ( $X=Y$  is the same as  $Y=X$ ), and is not the same as assignment.**
- **Any value can be unified with itself. (This is normally useful only as a test.)**
  - ◆ Example:  $mother(john) = mother(john)$
- **A variable can be unified with another variable. The two variable names thereafter reference the same variable.**
  - ◆ Example:  $X = Y, X = 2, write(Y).$  /\* Writes the value 2. \*/

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 21

### Unification

- **Two different values can be unified if there are unifications for the constituent variables which make the values the same.**
  - ◆ Example:  $mother(mary, X) = mother(Y, father(Z)).$  [Also results in the unifications  $mary=Y$  and  $X=father(Z)$ ].
- **It is legal to unify a variable with an expression containing itself; however, the resultant value cannot be printed, and must otherwise be handled with extreme care.**
  - ◆ Example:  $X = foo(X, Y).$

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 22

### Instantiation

- **A variable can be unified with any Prolog value; this is called instantiating the variable. A variable is fully instantiated if it is unified with a value that does not itself contain variables.**
  - ◆ Example:  $X = foo(bar, [1, 2, 3]).$  /\* X is fully instantiated. \*/
  - ◆ Example:  $Pa = husband(Ma).$  /\* Pa is partially instantiated. \*/

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 23

### Unification operator

```

:- f(1) = f(X), =(Var,123).      :- 4 = 1 + 3.
X = 1                             no.
Var = 123

:- f(X, g(X, Y)) = f(123,
:- X = 1 + 3, Y is 1 + 3.      g(Z, Z)).
X = 1 + 3                       X = 123
Y = 4                           Y = 123
                                 Z = 123

:- A + 1 = red + 1.
A = red

```

Université de Montréal Cours IFT 3880 Applications distribuées, tous droits réservés / 24

## Complex Unification

(Zaniolo, C. 1984 *Object-oriented programming in Prolog*)

```
area( rect( H , W ) , A ) :- A is H * W .
area( square( Side ) , A ) :- area( rect( Side, Side), A ) .
area( triangle( H, W), A ) :- A is ( H * W ) / 2 .
```

```
:- X = square(10) , area(X,Z) , write(area=Z) .
area=100
ok
```

- selection of rule
- parameter passing (values in / out)
- Note use of = to combine terms

Cours IFT 3880 Applications distribuées, tous droits réservés / 25

## ==, = & is

- :- X = 1 + 2 .
- X = 1 + 2
- :- X == 1 + 2 .
- **no**
- :- X is 1 + 2 .
- X = 3
- :- X is f(1, 2) .
- **ERROR: Arithmetic: `f/2' is not a function**

Cours IFT 3880 Applications distribuées, tous droits réservés / 26

## Inequality

- **Not unifiable** \=
- ◆ :- joe \= fred.
- ◆ ok
- ◆ :- X \= 123 .
- ◆ no
- ◆ :- 1 + 2 \= 3 .
- ◆ ok
- ◆ :- 1 + 2 \= X .
- ◆ no
- **Not Equal** ==
- ◆ :- 1 + 2 == 3 .
- ◆ no
- **Not Identical** \==
- ◆ :- 1 + 2 \== 3 .
- ◆ ok

Cours IFT 3880 Applications distribuées, tous droits réservés / 27

## Input / Output

- **write(+Term)**
  - ◆ Write *Term* to the current output, using brackets and operators where appropriate.
- **read(-Term)**
  - ◆ Read the next Prolog term from the current input stream and unify it with *Term*.
- **nl**
  - ◆ Print a new line
- ...

Cours IFT 3880 Applications distribuées, tous droits réservés / 28

## Input / Output

```
:- write('Input: '),
   read(I),
   I2 is I+1,
   write(I2), nl .
```

```
Input: 123 .
124
ok
```

Cours IFT 3880 Applications distribuées, tous droits réservés / 29

## Assert & Retract

- To update the database during execution
- :- male(X).
- X = fred ;
- X = toto
- :- assert( male(john) ).
- :- male(X).
- X = fred ;
- X = toto ;
- X = john
- :- retract( male(toto) ).
- :- male(X).
- X = fred ;
- X = john

Cours IFT 3880 Applications distribuées, tous droits réservés / 30

## Assert, asserta & assertz

- **assert(+Term)**
  - ◆ Assert a fact or clause in the database. Term is asserted as the last fact or clause of the corresponding predicate
- **asserta(+Term)**
  - ◆ Equivalent to assert, but Term is asserted as first clause or fact of the predicate.
- **assertz(+Term)**
  - ◆ Equivalent to assert.

## Assignment

- **Pascal**
  - ◆ Var x;
  - ◆ x := 5;
  - ◆ writeln (x);
  - ◆ x := x+1;
- **Prolog**
  - ◆ assert( value\_of( x,5 ) ),
  - ◆ value\_of( x,X ), writeln( X ),
  - ◆ retract( value\_of( x,OldX ) ),
  - ◆ NewX is OldX+1,
  - ◆ assert( value\_of( x,NewX ) ).

## List Processing

- **Lists:**
  - ◆ Dynamic data structures
  - ◆ Trees
  - ◆ Graphs
- **special symbol for empty list:**
  - ◆ nil or []
- **binary nodes: "|" or "."**
  - ◆ Left = first
  - ◆ Right = rest of list

## Example of list

[1,2,3,4]

## List Processing

- **Accessing elements**
- **Building lists**

∴ [1,2,3] = [\_ ,A| B] .  
A = 2 , B =[3]

## Procedures for Lists

- **first (E,L)**
    - ◆ E is the first element of the list L
- first ( X , [X|\_] ) .
- ∴ first ( C , [red,white,blue] ) .  
C = red

## Procedures for Lists

### ➤ last (E,L)

- ◆ E is the last element of the list L

```
last( X , [X] ) .
```

```
last( X , [_ Rest] ) :- last( X , Rest ) .
```

```
:- last ( C , [red,white,blue] ) .
```

```
C = blue
```

## Procedures for Lists

### ➤ member( E,L )

- ◆ E is a member of the list L

```
member ( X , [X_] ) .
```

```
member ( X , [_ Rest] ) :- member( X , Rest ) .
```

```
:- member( red , [red,white,blue] ) .
```

```
ok
```

## Using the Rules

### ➤ Generator

```
:- member( X , [red,white,blue] ) .
```

```
X = red ;
```

```
  ◆ member( X , [white,blue]
```

```
X = white ;
```

```
  ◆ member( X , [blue]
```

```
X = blue
```

### ➤ Constraints

```
:- L = [_,_,_], member( fred,L ), member (3,L), last(zzz,L) .
```

```
L = [fred,3,zzz] ;
```

```
L = [3,fred,zzz]
```

## Logic Black Holes

### ➤ infinite loops after a few good answers

### ➤ generators of elements of infinite set (i.e. lists)

### ➤ Example

```
:- member( 1 , L ) , L = [X,X] .
```

```
L = [1,1] ;
```

```
L = [1,1] ;
```

```
..... infinite loop ...
```

- ◆ The first term generates all lists of which "1" is a member:

```
[1], [1,..], [_,1], [_,1,..], [_,_,1], [_,_,_,1]... etc ...
```

- ◆ Only two are acceptable, but the generator keeps providing candidates for the second term to reject.

## Control Predicates

### ➤ fail

- ◆ Always fail. The predicate fail is translated into a single virtual machine instruction.

### ➤ true

- ◆ Always succeed. The predicate true is translated into a single virtual machine instruction.

### ➤ repeat

- ◆ Always succeed, provide an infinite number of choice points.

### ➤ !

- ◆ Cut. Discard choice points of parent frame and frames created after the parent frame.
